```
Logistic Regression Project
           In this project we will be working with a fake advertising data set, indicating whether or not a particular internet user clicked on
           an Advertisement. We will try to create a model that will predict whether or not they will click on an ad based off the features of
           that user.
           This data set contains the following features:
             • 'Daily Time Spent on Site': consumer time on site in minutes
             • 'Age': cutomer age in years
             • 'Area Income': Avg. Income of geographical area of consumer
             • 'Daily Internet Usage': Avg. minutes a day consumer is on the internet
             • 'Ad Topic Line': Headline of the advertisement
             • 'City': City of consumer
             • 'Male': Whether or not consumer was male
             • 'Country': Country of consumer
             • 'Timestamp': Time at which consumer clicked on Ad or closed window
             • 'Clicked on Ad': 0 or 1 indicated clicking on Ad
           Import Libraries
           Import a few libraries you think you'll need (Or just import them as you go along!)
 In [1]: import pandas as pd
           import numpy as np
           import matplotlib.pyplot as plt
           import seaborn as sns
           %matplotlib inline
           Get the Data
           Read in the advertising.csv file and set it to a data frame called ad_data.
 In [2]: ad_data = pd.read_csv('advertising.csv')
           Check the head of ad_data
 In [3]: | ad_data.head()
 Out[3]:

           Exploratory Data Analysis
           Let's use seaborn to explore the data!
           Try recreating the plots shown below!
           Create a histogram of the Age
 In [6]: | ad_data['Age'].plot.hist(bins=30)
 Out[6]: <matplotlib.axes._subplots.AxesSubplot at 0x15e5dc4e908>
              80
              60
            Frequency
&
           Create a jointplot showing Area Income versus Age.
 In [7]: sns.jointplot(x='Age', y='Area Income', data=ad_data)
 Out[7]: <seaborn.axisgrid.JointGrid at 0x15e5e454108>
              80000
              70000
              60000
           Area Income
20000
              30000
              20000
                      20
                                                   50
           Create a jointplot showing the kde distributions of Daily Time spent on site vs. Age.
 In [8]: sns.jointplot(x='Age',y='Daily Time Spent on Site',data=ad_data,kind='kde')
 Out[8]: <seaborn.axisgrid.JointGrid at 0x15e5e5d3848>
              100
            Daily Time Spent on Site
               60
               40
               20
                                               50
                                                             70
                         20
                                                      60
                 10
                                30
                                        40
           Create a jointplot of 'Daily Time Spent on Site' vs. 'Daily Internet Usage'
In [10]: | sns.jointplot(x='Daily Time Spent on Site', y='Daily Internet Usage', data=ad_data)
Out[10]: <seaborn.axisgrid.JointGrid at 0x1f92baec388>
              275
              250
              225
              150
              125
              100
                               Daily Time Spent on Site
           Finally, create a pairplot with the hue defined by the 'Clicked on Ad' column feature.
In [10]: sns.pairplot(ad_data, hue='Clicked on Ad')
Out[10]: <seaborn.axisgrid.PairGrid at 0x15e5f816fc8>
              80000
              70000
             60000
              50000
              40000
              30000
              20000
              10000
               275
               200
              175
             <u>____</u> 150
               125
               100
               1.0
               0.2
                                                         0 20000400006000080000
                                                                               100 150 200 250 300 -0.5 0.0
                                                                                                        0.5 1.0 1.5
                                                                                Daily Internet Usage
           Logistic Regression
           Now it's time to do a train test split, and train our model!
           You'll have the freedom here to choose columns that you want to train on!
           Split the data into training set and testing set using train_test_split
           from sklearn.model_selection import train_test_split
           ad_data.head()
Out[13]:
                                              Daily Internet
               Daily Time Spent
